National Registry of End Stage Renal Disease
(ESRD)

12th Annual Report

2019

Prepared by:
Dr. Waddah W. Saleh
Head of ESRDR

Supervised by
Dr. Ghazi Sharkas
Assistant Secretary General For PHC
Dr. Nashaat Taani
Head of NCD Directorate
Foreword

It is my pleasure to present to you the eleventh report of the Jordan National End Stage Renal Diseases Registry (ESRDR) for the year 2019, hoping that this report will assist health care providers, public health officers, and NGO’s in their work to prevent and control renal disease in Jordan.

The data presented in this report constitutes an organized and systematic data of ESRD registry, it provides prevalence, incidence and burden of ESRD in Jordan, and it will provide readers with information on the epidemiology of ESRD in Jordan and its distribution by age groups, gender and governorates. It also assists researchers, renal diseases experts and policy makers in identifying priorities for developing national strategies and programs for renal diseases early detection as well as prevention programs.

I express my greatfulness and appreciation to everyone who helped in the preparation and dissemination of this report, and assures all of you that the Ministry of Health will continue to support National End Stage Renal Diseases Registry by all available resources to make its mission ongoing and of greatest benefit.

H.E Minister of Health

Prof. Dr. Nathir Meleheh Obeidat
Part one

Back ground

- The first kidney transplantation done in Jordan was on 18/05/1972 at the same main Military Hospital. It was the first to be done in the Middle East.
1981- The establishment of renal dialysis unit at Jordan university Hospital. The machine type was REDY “Sorbs system”. It was portable, moving to Khaldi and Islamic Hospitals.
1982- The first renal dialysis Unit was established in private sector, it was at Al-Khaldi Hospital.
1984- The first kidney transplantation was done in private sector at Islamic Hospital, then at Al- Khaldi Hospital.
2009- The first kidney transplantation in Jordanian public hospital was done at Prince Hamza Hospital in October 2009 according to The Jordanian National Program Of Renal Transplantation of the JMOH.

So dialysis was introduced in Jordan in 1968. Ever since, there has been a continuous expansion of the dialysis centers in terms of the geographic coverage and capacity. The economic prosperity helped building the services all over the country.

Modern hemodialysis machines were installed in the vast majority of units, which allowed for the performance of bicarbonate dialysis, controlled ultra filtration, and sodium profile modeling. Also a wider choice of biocompatible dialyzers has become available during the last few years.
Recently, there has been an emerging concern about the projection of the increasing number of patients on dialysis and the future cost. Therefore, close observation of the development of dialysis has been a demand of the Jordan center for organ transplantation. Preparing annual reports about all the modalities of RRT has become a demand activity.

National ESRD Registry, which is based on center and patient forms, is a useful tool to assess the quality of dialysis services and activities used to improve the adequacy of hemodialysis.

Jordan has had a growing number of persons developing CKD leading to ESRD. It is important to have a national registry in order to define the cause of ESRD, and to be able to perform (Inter) National comparisons in renal epidemiology.

Such a registry will monitor the causes, incidence, and prevalence of ESRD and any emerging trend.

A national ESRD registry will allow the determination of the burden of disease as well as planning and policy formulation in the health care sector. As the Registry develops, data will become available for patients with ESRD, as is reported here.

Finally, it is a great achievement to establish the National ESRD Registry, a new achievement in renal events in Jordan.
National Registry of End Stage Renal Disease:
The National Registry of End Stage Renal Disease was created in May 3\textsuperscript{rd}, 2007 under the jurisdiction of the Ministry of Health by the order of his Excellency the Minister of Health.

Objectives of the National Registry of End Stage Renal Disease:

- Establish a national database system about patients of ESRD.
- Determine the burden of that disease, on country basis.
- Determine governmental payment on dialysis.
- Provide data about patients and their suitability to be transplanted, on a basis of priority.
- Stimulate beginning studies and researches about ESRD.
- Improve facilities of diagnosis and treatment for ESRD patients. Moreover, train dialysis technicians and national registry employees.

Methodology:
The National Registry of End Stage Renal Disease was created in 2007 and supported by the Ministry of Health. It is a database-system that collects data and information about almost all patients undergoing Renal Replacement Therapy (RRT), i.e. either dialysis (hemodialysis and peritoneal dialysis) or Kidney transplantation.
This is the 12th national ESRD Registry report. Data were received from all (87) dialysis units in Jordan. It is assumed that those undergoing treatment in these units are represent the number of all ESRD cases, because all cases are treated on the expense of the government and even the patients undergoing home peritoneal dialysis.

Data about all ESRD patients (all nationalities) who are receiving treatment in all dialysis units in Jordan (governmental, military, private and university hospitals) (RRT) during the year 2019 from 1st Jan -31 Dec -2019 were collected from all dialysis units in the hospitals and then analyzed using special software statistical analysis (SPSS), Epi Info 7 and Excel.

Two questionnaires (forms) used for data collection from hospitals. The first one is for the dialysis units: including number of beds, type of insurance of patient, nationality (Annex1).

The second form is for the patients, this form consist of demographic data, clinical data, source of treating facility, follow up and vital status of the patients and all these data will entered on special software for ESRD patients (Annex2). Patients who are not on Renal Replacement Therapy (RRT) and those who only received urgent dialysis or died shortly afterwards (less than 90 days) were not included in this report.

**Method of Data Collection:**

Data was collected from all renal dialysis units in Jordan, through the following methods: two types of data collection methods were applied:

1- Passive Data Collection: in this system forms filled by dialysis units technicians and send to national renal registry - MOH/NCDs Directorate.

2- Active Data Collection: In this system the head of Renal Registry Unit visited the dialysis units and fills the forms on the unit and complete all the variables from medical record of those patients. This to ensure more complete and accurate data.
All forms were reviewed at the Renal Registry Unit and filtered and checked for any duplication and also document follow up data if the patient still alive or dead cause of death dates of last dialysis.

Data entered to special software designed for data of renal patients, Data analysis was done by using statistical package for the social sciences SPSS , Epi info 7 , and Microsoft excel .

Incidence and prevalence calculations in this report are based on the population by Department of Statistics (DOS) 2019

Part Two

Dialysis Units in Jordan

There were 87 working Dialysis Units distributed all over the country. 37 units (43%) administered by Ministry of Health (MOH), 12 units (14 %) administered by Royal Medical Services (RMS), 2 units (2 %) administered by university hospitals: one administered by Jordan University Hospital, one by King Abdullah University Hospital (KAUH) and 36 units (41%) administered by Private Sector (PS),(Figure 2).

Figure (2) Distribution of dialysis units by health sector, Jordan 2019
Distribution of Dialysis Machines by Health Sector, Jordan 2019.
The total number of dialysis machines (932) in all units was distributed as followed: 435 (46.7%) machines in MOH units, 84(9.0%) machines in RMS, 34(3.6%) machines in universities hospitals and 379 (40.6%) machines in private sector hospitals, (Figure 3).

The focal points in all 87 Dialysis Units filled the special form of data collection and send it to National ESRD Registry located in the Ministry of Health. (Annex1), data about ESRD patients was received from all hospitals.
Part three

ESRD patients in Jordan

Prevalence of ESRD patients in Jordan (2019)

The total numbers of patients treated and registered in the Jordan Renal Registry by the end of 2019 was 6708 patients; of them 6316 were Jordanians (94 %) and 391 were non Jordanians (6 %).

This part of the report only includes Jordanian patient –prevalence 2019

The number of Jordanian patients that registered in ESRD and treated in hospitals for the year 2019 was 6316 patients, while the number of new cases of ESRD for the year 2019 was 750 patients, out of them 719 patients (95.8 %) were Jordanians, 31 (4.2 %) were non Jordanians.
Prevalence of ESRD Patients in Jordan, 2019

The total number of ESRD patients during the year 2019 was 6316 patients who are receiving hemodialysis or peritoneal dialysis in the hospitals from all sectors.

Distribution of ESRD patients according to age groups and gender, 2019

Table (3) shows the distribution of ESRD patients according to the age groups and gender,. The median age of patients was (56) years, (54 years for males and 57 years for females).

Table (3) also shows the distribution of ESRD cases by prevalence rate per million populations (PPM), the overall prevalence per Million Populations in Jordan was (864.5 /1,000,000).

Socio demographic characteristics of ESRD prevalent patients:

Figure (4) shows the distribution of patients who underwent dialysis treatment in renal dialysis units in all Jordanian hospitals during the year 2019 according to gender. The number of patients treated in the Dialysis Units was 6316 patients, out of them 3881 were male patients which accounted (61 %), and 2435 were female patients accounted (39 %), with male to female ratio 1.5:1.

Fig. (9) Distribution of primary causes of ESRD for the year 2019
Co-morbidity and some risk factors with ESRD

The data showed the presence of other medical conditions coexisting with the ESRD condition itself.

The prevalence of co-morbidity in ESRD patients showed that (52.9%) of patients were hypertensive, (45.5%) Diabetes, while cardiovascular diseases were found in (12.6%) of ESRD patients. Smoking in ESRD was (8.7%) and (4%) of the patients had family history of renal diseases, Table (9). And Fig.(10)

Table (14) shows the Prevalence of Hepatitis B and C in ESRD patients

(0.9 %) of the cases had Hepatitis B , and (1.9 %) had Hepatitis C.
Part Four

Incidence of ESRD Patients

The total number of Jordanian patients who treated in the dialysis units by the end of 2019 were (6316) patients, but the number of new cases for the year 2019 was 750 patients, of them (719) were Jordanians (95.8%) and (31) were non Jordanians (4.2%).

This part of the report only include Jordanian patient — incidence 2019. The number of new cases of ESRD Jordanian patients for the year 2019 was 719 patient.

Incidence of ESRD, 2019

Table (15) and Figure (18) show the distribution of ESRD incident patients in 2019 according to the age group and gender, with a mean age of 55 years, and median age of 56 years. Table (15) also shows the distribution of ESRD patients by Age-Specific Incidence Rate per million (ASIR). The overall Incidence per Million Populations in Jordan was (98/1,000,000).
